

CREATISH INC.

Greeno

The someone who runs your day. A companion that lives in the Mac notch, learns you in one conversation, and speaks first.

● Pre-release · macOS

He waddles around down there while you work. We are aware of how that sounds.

Why people stop using productivity software.

Not because it is bad. Because it waits. Anything you have to remember to open is a thing you eventually stop opening, and no amount of feature work fixes that.

75%

of iOS app installs are gone after day one

95%

are gone by day thirty

12%

day thirty retention already counts as strong for a productivity app

Every tool in this category competes on what it can do once you open it. None of them compete on getting opened.

Business of Apps, App Churn Rates, 2026. Userpilot, App Retention Benchmarks, 2026.

Two categories, and neither one does *both jobs*.

COMPANIONS

2 hours

A someone, with no job.

Character.AI holds over twenty million monthly users for about two hours a day each. The attention is real. It does nothing for your Tuesday.

ASSISTANTS

\$2.48B

A job, with no someone.

Spent inside the ChatGPT mobile app in 2025, up from \$487 million in 2024. It does the work, and it waits to be asked.

Greeno sits between them on purpose. The character is what keeps him. The job is what pays for him.

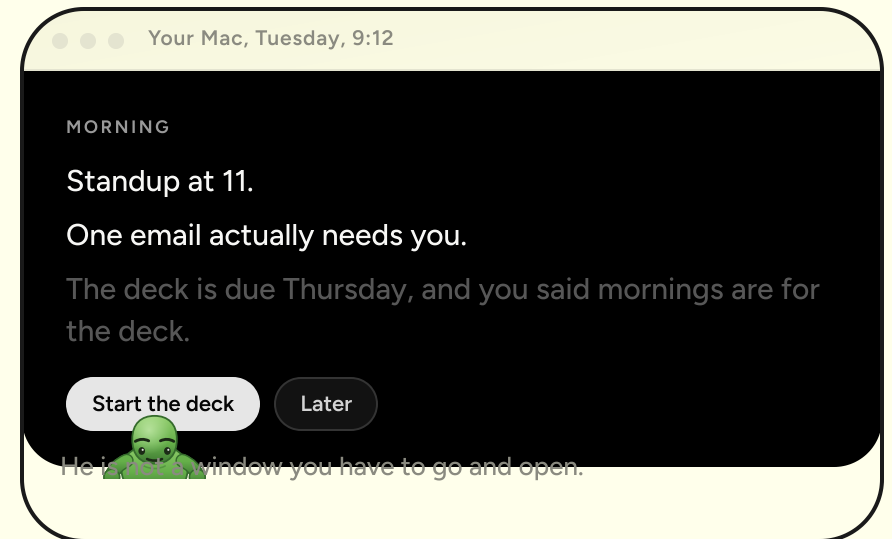

Demandsage, Character.AI Statistics, 2026. Appfigures, ChatGPT consumer spend, December 2025.

THE PRODUCT

He speaks first.

Greeno lives in the Mac notch. He is not a window you go and open. At his own moment the notch drops, he says the thing, and then he goes away again.

- One voice onboarding, no typed forms, and he has your week.
 - Calendar and inbox, overlaid on what you told him about yourself.
 - Everything he holds is one notebook, in your words, editable line by line.
-
- Nothing runs on your Mac until you say yes.

He shows up at *exactly three moments*.

A fourth is how this becomes annoying software, so there is no fourth timer anywhere in the app.

ONCE A DAY

Morning greet

The notch drops at your own start time. Calendar, the overnight mail that actually needs you, what is due, and only then the thing you said you cared about.

THIRTY MINUTE FLOOR

Stuck nudge

He glances at the screen and mostly says nothing. When he does have something, the notch says so and waits for you to open it. Then he stands down.

YOUR EVENING

Night debrief

How did it go. You talk for two minutes, the notebook fills in live on screen while you do, he reacts, and the day closes.

Nudges fire on events, never on blind timers. A timer that goes off while you are deep in something is the fastest way to get uninstalled.

Seven minutes of talking. *Zero typed forms.*

1

The yap

Five questions, out loud. A normal day, what keeps slipping, when your head is clear, what you listen to, and what you wish just happened on its own.

2

The notebook

It builds itself on the right while you speak. Routines, habits, focus. Three sections, in your words, and you can edit every line of it.

3

The read back

He reads it back and you approve it. The target is nine of ten users approving with no edits at all.

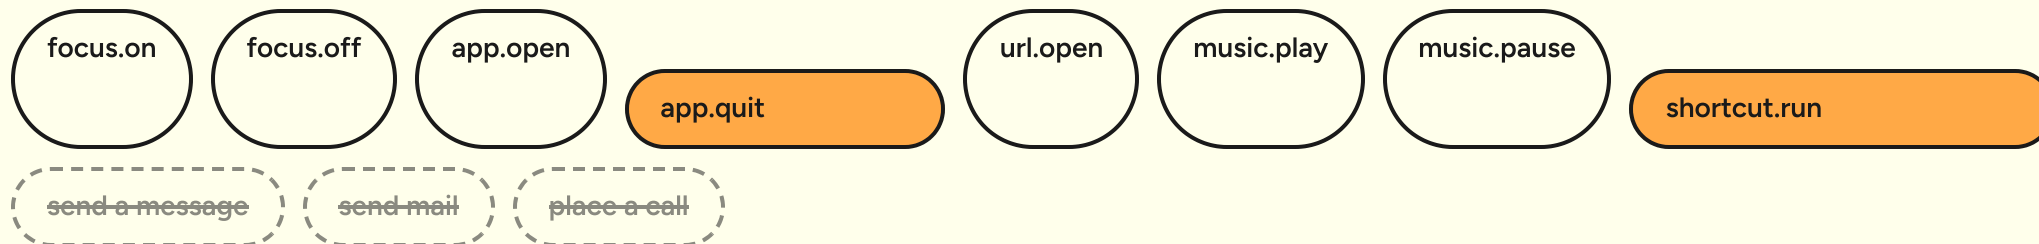

WHY IT MATTERS

Day seven beats day one

Onboarding does not end at setup complete. It ends the next morning, when the greet references something you told him yesterday. That is the only proof that counts.

A closed list. *Nothing else, ever.*

This is everything he can do to a Mac. It is enforced in code rather than asked for in a prompt, and a test fails if anybody adds to it.

Nothing on the list can contact a person. He will remind you to text your mum and he will never text her. Chores get automated. Relationships do not. The two in amber ask every time, because closing somebody's unsaved work is not undoable.

The market, *in three numbers.*

TAM

\$24.1B

Spent on AI companions in 2026, growing thirty one percent a year to \$70.9 billion by 2030.

He lives in the notch

SAM

100M+

Macs in active use, and 25.6 million more shipped in 2025 alone. The machine is the market.

Already pays for AI

OUR FIRST TARGET

\$24M

A hundred thousand paid seats at twenty dollars a month. That is the shape of the first business, not the ceiling of it.

The Business Research Company, AI Companion Global Market Report, 2026. Apple, active Mac install base. IDC Worldwide Quarterly PC Tracker, 2026. All figures in USD.

How we make money.

FREE

The someone

The character, the morning greet, the night debrief and the notebook.
Everything it takes to find out whether he actually shows up.

PAID

\$20 a month

Calendar and inbox, the stuck nudge, focus mode, routines, and Hera dictation. Everything that needs your day, not just your attention.

WHY FREE EXISTS

It is the acquisition. Nobody pays for a companion before he has proved he shows up, and proving that takes a week of mornings. **It is also the training set.** Every free conversation is what makes the next morning's greet sharper, so usage on the free tier is the thing that improves the paid one.

Where we are today.

Early, and the numbers say so. The whole loop runs end to end on a Mac, and early access is going out in small batches.

Live

Voice onboarding, notebook, morning greet and night debrief, running end to end.

2

Builds off one server: the Mac app, and the web app for people without a notch.

On the early access list.

fill in

Testers through a full week of mornings.

There is no revenue number here yet and the product page says so out loud. What we are measuring in the first cohort is one thing: does the day seven greet beat the day one greet.

The competition.

CATEGORY	WHAT IT DOES	WHAT IT LEAVES YOU	PRICE
Chat assistants ChatGPT, Claude	Answers anything you bring it	Remembering to open it	\$20
Scheduling AI Motion, Reclaim	Moves blocks around your calendar	Everything that is not a calendar	\$19
Meeting notes Granola, Otter	One meeting, written up cleanly	The other seven hours	\$14
Inbox AI Superhuman	A faster inbox	The rest of the day	\$30
Companions Character.AI, Replika	Someone to talk to	The whole job	\$10
Greeno	Speaks first and holds the day	Approving what he suggests	\$20

Every row above waits to be opened.

What we build next.

Q4 2026

The loop

Onboarding, notebook, morning greet and night debrief on macOS. Early access in small batches.

Q1 2027

Connections

Google Calendar and Gmail. Timetable parsed from a photo and approved. Focus mode through a real Shortcut, so it syncs to the phone.

Q2 2027

The character

Moment routing in the voice path, reaction states, and the stuck nudge firing on real screen events.

Q3 2027

Week one

In context micro questions and Hera dictation, so he keeps getting sharper after the yap is over.

Everything after the first column is gated on one result. If the day seven greet does not beat the day one greet, the learning layer is not working and we fix that before we build anything else.

Make every day feel *a little less boring.*

The loop runs end to end today, on a Mac.

Nothing runs on your machine until you say yes.

He speaks first, or he is nothing.
